

G'day investors!

Welcome to Wilma Wealth Management, I am White Green, your most trusted investment companion!

In tonight's session, here is an overview of the course content:

1. The reasons behind the significant drop in Australia's three major stock indices today and an assessment of their subsequent trends.
2. the in-depth analysis of the gold moving average buy point
3. Analysis of individual stocks in the investment portfolio.

Tonight's session is not just a learning opportunity but also a valuable chance to genuinely enhance your investment skills. I will use specific examples to demonstrate how to apply this classic technique, helping you stand out in the market.

Today, the three major indices on the Australian Securities Exchange experienced a significant decline. The XJO Index was particularly hard hit by the combined sell-off in key sectors. Shortly after the market opened, the index rapidly fell. After a period of consolidation around the 7700-point MA89 moving average support level, the release of the latest CPI data further intensified market pressure. This data prompted a reassessment of interest rate cut expectations for the year, leading to an accelerated decline in the XJO Index, which maintained a downward trend throughout the day.

From a sector performance perspective, all 11 major industry sectors on the Australian market recorded declines today. The staples, financials, and industrials sectors led the losses, with the staples sector particularly falling by over 2%. Additionally, while the information technology, energy, and materials sectors also experienced declines, their losses were relatively smaller, with the materials sector down by 0.7%.

According to today's data from the Bureau of Statistics, the inflation rate unexpectedly accelerated in April, rising slightly from 3.5% in March to 3.6%. This increase was mainly driven by a significant rise in health insurance costs faced by consumers and the higher costs of fruits and vegetables due to adverse weather conditions. The market had initially expected inflation to ease, but this data release has diminished the likelihood of an interest rate cut this year.

With the release of the CPI data, market expectations have gradually shifted from a rate cut to a rate hike, reflecting that inflation has not continued to decline as anticipated. The Australian dollar briefly rose to 66.68 US cents following the news, while Australia's three major stock indices came under pressure, showing an accelerated downward trend.

It is worth noting that given the inherent volatility of CPI data and the relatively few price items surveyed by the Bureau of Statistics in April, these changes may not be sufficient to materially alter the interest rate outlook. Therefore, while the market reaction may reflect an adjustment in expectations towards tighter monetary policy, whether the Reserve Bank of Australia will take action in response to the rapid rise in prices remains to be seen. More data and trends need to be observed to make a more informed decision.

In today's trading, the performance of the XJO Index reflected the market's reaction to the current economic data. The index quickly moved downwards in the early session under the pressure of the 5-day moving average, consolidating near the 7700-point level of the 89-day moving average. Following the release of the CPI data, which showed a negative impact, the index accelerated its decline. Today, the index formed a large bearish candlestick with almost no upper or lower shadows, indicating that bearish forces dominated the day, with bulls showing virtually no resistance.

However, it is important to note that despite today's significant decline, the year's trend remains within an upward channel, indicating that the overall upward trend structure has not been disrupted. In the coming trading days, special attention should be paid to the performance of US stocks overnight. If US stocks continue to adjust, this could further impact the XJO Index, prompting it to seek lower support levels in subsequent trading days. For potential investors, the current adjustment phase may provide an excellent entry point, which is why we mentioned to investors on Tuesday that we would position ourselves for swing trades on individual stocks on Thursday or Friday.

In the world of investing, the best buying opportunities often arise when the market is in a state of panic, while the greatest risks often lurk when the market is excessively greedy.

Yesterday, we delved into the various trading rules of the Golden Mean moving averages. Today, we will continue to elaborate on and reinforce the key essentials of the Golden Mean buy point. By mastering these Golden Mean buy point techniques, we will be able to more accurately predict and leverage short- to medium-term price movements. Understanding the application of these technical analysis tools will significantly enhance our operational confidence and decision-making efficiency in the market, ensuring that we can trade at the right time and optimise investment returns.

Going long: The candlestick chart runs above the MA5 moving average. During a pullback, it falls below the MA13 moving average, but the MA13 moving average

continues to rise. When the candlestick quickly regains the MA13 moving average, go long.

The chart shows ANZ's daily candlestick chart. The candlestick chart has been running above the MA5 moving average. During a pullback, the price fell below the MA13 moving average, but the MA13 moving average continued to rise. After some consolidation, the candlestick chart regained the moving average and eventually led to an upward trend.

JBH exhibited a similar pattern. The stock price fell below the MA13 moving average, but the MA13 moving average continued to rise. Subsequently, after the price regained the MA13 moving average, it initiated a new upward trend.

Going long: When the moving average is trending down and the candlestick chart is running below it, followed by a sudden sharp drop that creates a significant distance between the candlestick chart and the MA13 moving average, the candlestick chart is likely to revert to the moving average. At this point, as it moves closer to the MA13 moving average again, a long position can be taken.

On the NHF daily chart, the candlestick chart shows a vertical decline below the MA13 moving average, distancing itself significantly from the MA13. Once the candlestick chart forms a bottom pattern, it is an opportunity to go long, anticipating a return to the moving average.

This trading signal mainly appears after a rapid upward or downward movement. In practice, you can observe if the candlestick chart shows a vertical rise or fall, which is very obvious and easy to identify. Then, watch for the candlestick chart to form a reversal pattern before entering the market, anticipating a return to the moving average.

In a recent session, some investors raised an interesting question. They were curious as to why our group offers financial education for free without charging any fees, and even asked if we might be scammers. I am very pleased to share with everyone the mission and vision of our group.

Do you remember how Uber captured the market share from Yellow Cabs and Silver Top Taxis ten years ago? Uber successfully implemented a series of innovative strategies. These strategies included offering subsidies and discounts, adopting transparent pricing and convenient payment methods, and improving service efficiency and response times. Specifically, in the early stages of the market, Uber quickly attracted a large number of users and drivers by offering significant discounts and free ride vouchers to passengers, as well as generous bonuses and rewards to drivers.

At the same time, traditional taxi services like Yellow Cabs typically relied on phone reservations and street hails, which often fell short in terms of service quality and user experience compared to the emerging service model. Consequently, through its innovative business model and marketing strategies, Uber quickly made a breakthrough in the Australian market, fundamentally changing our travel habits.

Similarly, in the food delivery sector, the success of Uber Eats and Menulog is also based on similar strategies. Both platforms employed efficient logistics and marketing strategies to ensure they maintained an advantage in a highly competitive market.

Through these analyses, we can deeply understand the importance of innovative strategies in modern business competition, especially in highly dynamic market environments. This is equally applicable to the entrepreneurs in our sessions. To maintain your company's competitiveness, it is crucial to adapt to market changes and continuously innovate your services and products. In such a market, only by

constantly adapting and innovating can you ensure your company's sustained success and maintain a leading position in the market.

The motivation behind our group's initiation of the online teaching model is similar to Uber's drive to expand its market influence. Our goal is to continually increase our visibility and impact in the financial sector.

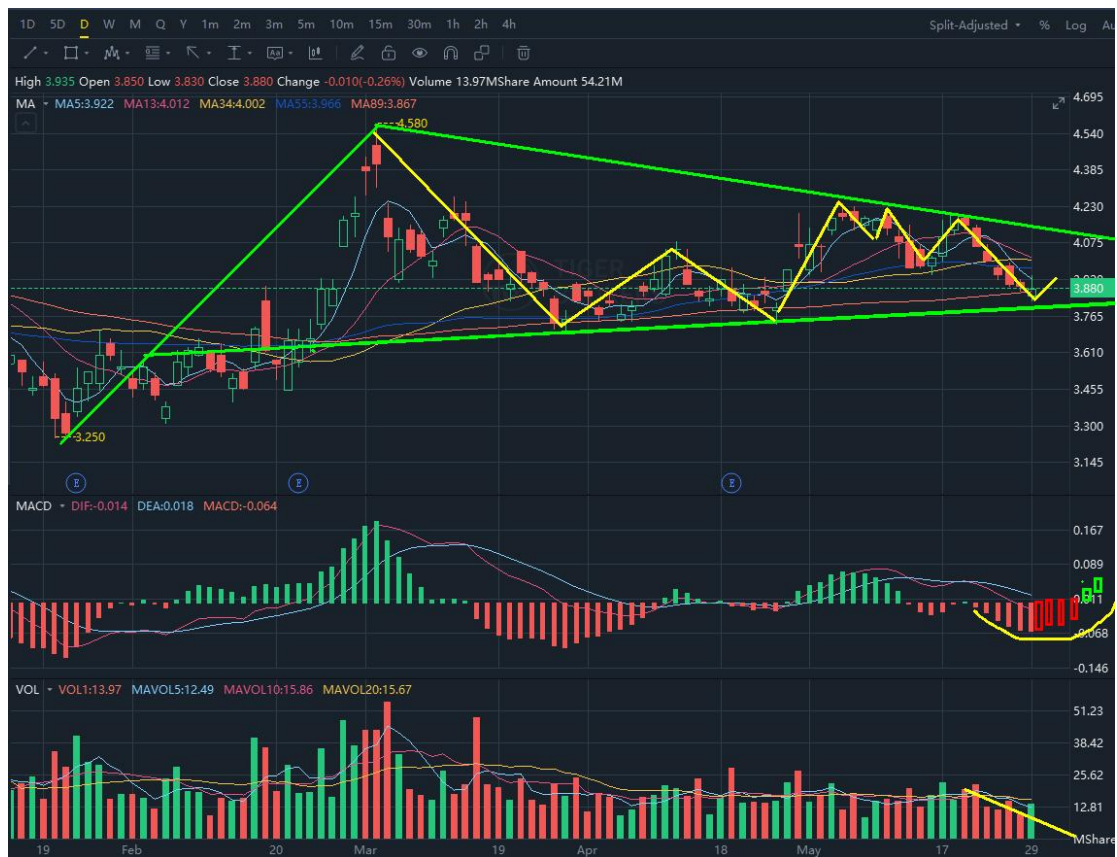

Given the professional nature of the financial field, our group primarily provides investment management services across various asset classes, including stocks, funds, bonds, cash equivalents, real estate, and alternative investments. Therefore, we cannot deliver an enhanced user experience to all users in the same way Uber Eats does. Our services cannot be directly compared to the user experience of Uber Eats.

By offering an online teaching model, our aim is to provide a comprehensive learning platform for financial participants in Australia. This platform covers the entire process from theoretical instruction to practical application and achieving profitability, helping investors master strategies for long-term, stable profits. We are dedicated to sharing successful investment experiences with individuals from all walks of life, aiding them in achieving wealth growth and transforming this knowledge into tangible economic gains.

To allow more people to understand and trust our platform, we have chosen to attract the initial loyal followers and users by sharing our knowledge for free. Over time, we believe that within six months to a year, our group will attract more followers and eventually become a new benchmark in the Australian investment community.

Therefore, dear investors, please rest assured that our goals are legitimate and long-term. We hope that through our joint efforts, everyone can benefit and achieve success in the financial markets. On your future investment journey, after six months or a year of learning and exchanging ideas together, would you be willing to recommend our group to the financial participants around you, helping us to accumulate more loyal users more quickly?

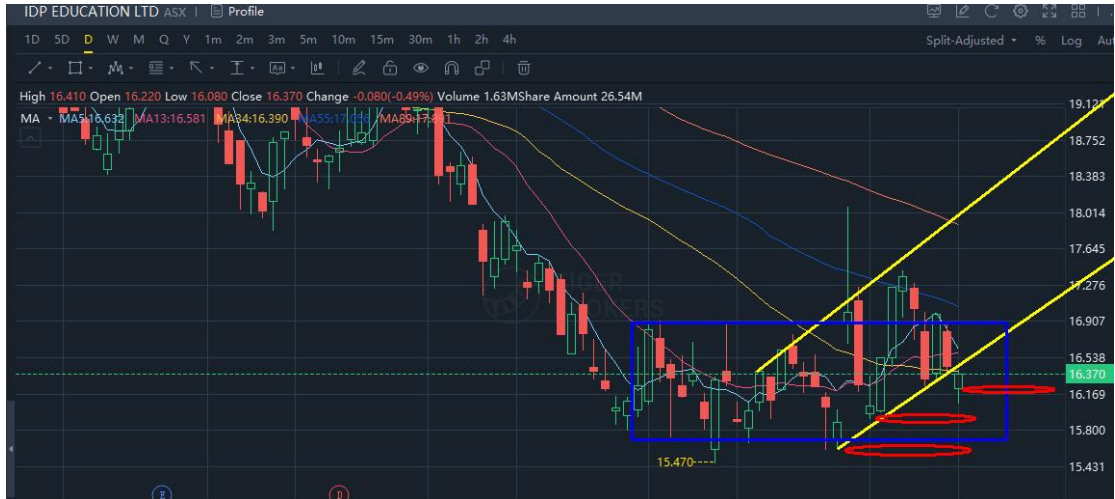

Next, let's review the performance of each stock in our investment portfolio in today's market and provide some preliminary comments. In tomorrow's morning review, I will offer a more detailed analysis, delving into the specifics of each stock so that we can better understand their market movements and develop corresponding investment strategies accordingly.

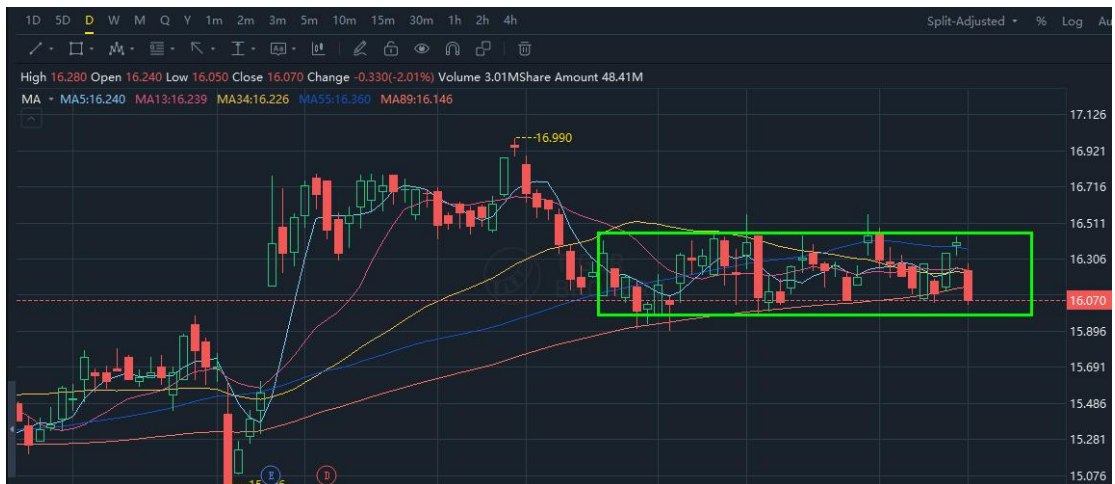

PLS: As mentioned to investors yesterday, after experiencing resistance at the AUD 4.2 level, the index underwent a week of low-volume adjustment, with bearish momentum being exhausted. Currently, the price is at the end of a wedge consolidation pattern. Today, the stock price stabilised and rebounded at the MA89 moving average, which is also near the lower support level of the wedge structure. Therefore, at the current level, it is advisable to patiently hold the stock and wait for an upward movement.

IEL: From the daily chart perspective, the stock price has gradually broken out of its consolidation pattern, with higher lows being established. The trend has slowly shifted from a consolidation phase to an upward trend.

COL:

COL continues to remain in a range-bound consolidation. Tomorrow, pay attention to the support at the bottom of the range. If the support holds, you can patiently wait for the stock price to make a directional move before making further investment decisions.

From the current market trend, the broader market has returned to a key support level. Observed market movements indicate that there is limited room for the index to continue its significant decline, which is why I advised investors on Tuesday to position for swing trades on Thursday. In swing trading, selecting the right timing and price entry points is crucial.

Therefore, tomorrow I will use our "Golden moving averages" buy point rules to provide investors with a stock suitable for swing trading and offer a more optimized entry point based on actual intraday changes. It is crucial to maintain smooth communication with my assistant during tomorrow's trading session so that we can promptly seize advantageous price entry points. This approach will help us execute our trading strategy more precisely and maximize investment returns.

So, dear investors, please be prepared to stay in close contact with us during tomorrow's intraday trading session to seize every possible opportunity.

Due to time constraints, today's session concludes here. Sincere thanks to every investor for your enthusiastic participation!

In tomorrow's session, we will delve into the key techniques of the "Golden moving averages" buy point and share with investors in detail which type of Golden Mean buy point we chose for tomorrow's stock positioning and the rationale behind the purchase. By combining theory with practical application, we can deepen our understanding of the effectiveness of the Golden Mean trading rules and significantly enhance our trading skills.

Good night, dear investors! I look forward to seeing you again in tomorrow's session as we continue our financial exploration journey.
