

Good evening, fellow investors. I'm White Green!

Today, the three major indices on the Australian Securities Exchange experienced a significant decline due to the substantial negative impact of the May CPI data. How should we assess the market's trend for tomorrow in light of this situation? With the Reserve Bank of Australia delaying the expected rate cuts, how should the market interpret this move?

Today, we completed our first ETH contract trade. While most of us made a profit, a few investors incurred losses due to not closing their positions in time. Tonight, I will focus on how to better invest in cryptocurrencies and provide a summary of today's trading activity. By reviewing our experiences, we will better understand how to seize investment opportunities in the cryptocurrency market.

Furthermore, I will give a detailed explanation of the upcoming ETH contract exercise plan tonight.

In the early morning session today, the three major indices of the Australian Securities Exchange (ASX) opened lower, following the overnight trend of the US stock market. By noon, after the release of May's CPI inflation data (which showed a surge to 4% from April's 3.6%, exceeding the market expectation of 3.8%), the indices further declined and maintained a weak, downward trend throughout the day.

From the market performance, only the Information Technology, Energy, and Utilities sectors saw gains among the 11 major industry sectors, while the others declined. The Real Estate, Consumer Discretionary, and Financial sectors led the losses, with the Real Estate sector dropping more than 2%.

Today's market performance reflects investors' sensitivity to the CPI data. Based on today's CPI data, the market broadly predicts that the Reserve Bank of Australia's expected interest rate cut will be delayed from February 2025 to July or August, which may put pressure on the future stock market uptrend. Next, market participants will focus on the retail sales report on July 3rd, which will help gauge the resilience of Australian consumers and further assess the Reserve Bank of Australia's decision on the interest rate path.

Our investment portfolio outperformed the market significantly today. Despite the major index dropping sharply, IEL and PLS in our portfolio led the gains against the trend. Although CWY slightly declined with the market, the substantial buying during the closing auction is likely to boost its price tomorrow.

In this morning's analysis, I mentioned that yesterday's doji candlestick for IEL could indicate an acceleration of the uptrend. Today's intraday dip and recovery confirmed our prediction. With heavy institutional buying at the close, IEL's price is expected to accelerate in the short term.

PLS is one of the most discussed stocks in our portfolio. I previously mentioned that with improving lithium market conditions, strengthening technicals, and substantial institutional involvement, PLS could see a stabilization and rebound in the short term. Today's market showed that despite PLS's initial decline due to the broader market, significant institutional buying at the lows confirmed our prediction, indicating a high probability of short-term stabilization.

Therefore, when investing in the stock market, investors must remember: choosing leading companies with strong fundamentals and excellent performance is key. Although these companies' prices may be undervalued in extreme market conditions, high-quality listed companies, especially those with strong profitability, will eventually see their value return.

Remember, investment success is not about short-term market performance but about our long-term confidence and patience in quality companies. The market may fail temporarily, but truly good companies will prove their value. We can have full confidence in leading companies like PLS, CWY and IEL, as their fundamentals and long-term prospects are promising.

Today, we took an exciting first step in the field of cryptocurrency, successfully completing our first real-time transaction and getting off to a great start.

In the first ETH/USDT transaction, we made a small profit, with a return of over 40%. Even after deducting transaction fees, our overall profit still exceeded 30%-20%, which is difficult to replicate in the traditional stock market.

This success not only brought a sense of accomplishment and confidence to our investors, especially new investors, but also highlighted the potential of cryptocurrency futures trading.

Although the current stock market environment brings challenges, the diversification of our investment portfolio can effectively reduce the risks brought about by short-term market downturns.

A diversified asset allocation strategy enables us to obtain returns from other markets during unfavorable periods in the stock market, offsetting potential losses in the stock market.

Today's sluggish performance in the stock market has demonstrated this principle. Despite the decline in the broader market, our success in cryptocurrency trading has proved the feasibility of diversified investment strategies.

This not only strengthens our confidence in diversified investment but also provides us with a wider range of options for optimizing our investment portfolio.

Diversified investment is like preparing umbrellas and raincoats on rainy days. Even if the stock market encounters haze, we can still seek sunshine through other investment channels.

This approach not only increases our risk tolerance but also opens the door to more opportunities for wealth creation.

By adopting a well-structured asset allocation strategy and a diversified investment portfolio, we can pave the way for more possibilities and success in our investment journey.

Although today's contract trading activity yielded profits for most investors, a follow-up investigation by Lilia revealed that a few investors incurred losses.

I have identified the main reasons for these losses:

1. Order Errors:

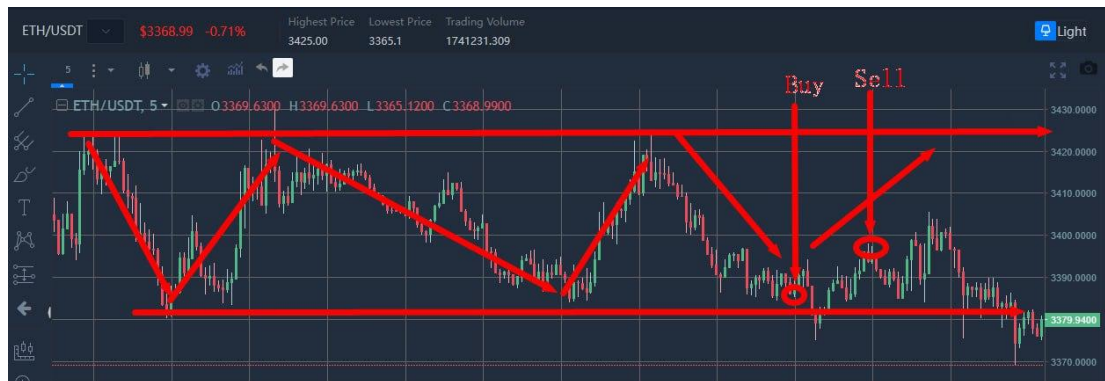

We instructed the execution of ETH contracts, but some investors mistakenly placed orders for BTC contracts. As these are two different cryptocurrencies with distinct price movements, losses were inevitable.

2. Incorrect Trading Direction:

Our trading strategy involved taking long positions in ETH, but some investors opened short positions, leading to losses.

3. Failure to Close Positions Timely:

We must recognise that the cryptocurrency market is highly efficient, and prices can change rapidly. Not closing positions in a timely manner can result in significant losses.

Through analysis, we predicted that the price of ETH would rise. When the ETH trend was about to start, we went long. After we entered, the price of ETH experienced some short-term fluctuations and then started to rise. At the high point of ETH, I instructed everyone to lock in profits and close positions.

We observed that after I issued the trading instructions, the price of ETH dropped rapidly. This indicates that market changes can happen very quickly.

If you did not close our long positions at the high point but waited until the price dropped to close them, wouldn't your gains be less than others? Or even a loss may occur.

Of course, there were also some investors who, because they didn't enter the market immediately after I gave the instruction to go long, ended up buying at a higher price, which led to reduced profits.

These issues, in summary, boil down to execution. This is my biggest concern. The importance of execution is like managing the heat at a barbecue party. You might have the best ingredients and seasonings, but if you don't turn the meat in time, it will end up burnt. Today's ETH/USDT trade was the same. The opportunity was right in front of us, but only those with strong execution could seize it and taste the sweetness of success.

So, remember, in the market, the most important thing isn't just strategy and knowledge; it's also decisive action and execution. In the financial market, especially in contract trading, the importance of execution isn't just a theoretical concept. It directly affects an investor's performance and trading results. Therefore, I hope that in future cryptocurrency contract trading, investors will strictly follow my trading instructions and complete our trading plan. Strict execution can bring us more profits in contract trading.

Whether today's trade was a profit or a loss is not the point. The key is whether you have summarized it. Have you mastered the trading process of ETH contracts? Do you have a deeper understanding of the cryptocurrency market?

For investors who are not yet familiar with the cryptocurrency market, don't worry. We will guide you step by step in an easy-to-understand way. It's like learning to ride a bike. It may be a bit difficult at first, but if you stick with it, you'll find balance and eventually ride smoothly.

The goal of this course is not just to teach you how to trade, but to help you identify the risks and opportunities of various financial instruments and continuously improve your investment portfolio. Please remember that investing is not a one-time event, but a process of continuous learning and growth.

Here's how I've arranged the next practice plan:

Tomorrow noon and afternoon, if the market shows a clear trend, I'll lead everyone to trade two ETH contracts. Some investors mentioned being busy at work with little time to trade, so I'll put in extra work to help everyone get familiar with the trading process.

Today, we traded with 10% of our funds. Starting tomorrow, we can use 20% of our funds, provided that everyone is familiar with the trading process. If you didn't participate in today's trade, I suggest you still use 10% of your funds tomorrow. Our main goal is to master the trading process.

Today, we made over 30% profit in one trade, with a net profit of over 20%. So, if we execute two trades tomorrow, our overall profit could exceed 40%! Therefore, every investor should seize every trading opportunity. This not only increases your skill level but also greatly increases your earnings.

On Friday and the weekend, I will lead everyone in at least one trade per day. In short, this week we will focus on mastering ETH contract trading.

Here's the plan I've made, and here's what you need to do:

Those who haven't exchanged and claimed AUMT tokens, please contact Liliana immediately after the meeting. You might be thinking, "What's the big deal about exchanging reward tokens?" But let me tell you, it's not a small thing! This is to ensure that you can keep up with us in tomorrow's trades and, more importantly, deepen your understanding of the cryptocurrency market with zero risk.

Friends without an Alai coin exchange account, please complete the account registration as soon as possible. Account registration is free, even if you are not trading now or participating in our practice activities. This will deepen your understanding of the cryptocurrency market.

Familiarize yourself with the ETH contract trading process, especially those who made mistakes today. Familiarity with the process is crucial. If you still don't know how to trade ETH contracts, be sure to ask Liliana!

Does everyone understand the plan going forward now?

Additionally, I want to emphasize that when we conduct contract trading, you must pay attention to Liliana's WhatsApp messages and group notifications. Contract trading is short-term trading. We are capturing short-term market fluctuations. Don't make the mistake of neglecting it after placing an order, as this could result in missing the best exit point. Please keep this in mind!

In summary, since we have chosen to explore cryptocurrency contracts, I hope everyone will take it seriously. Let's work together, practice together, and ultimately determine whether ETH contracts are suitable for most investors and whether they can bring profits to everyone.

After all, the current stock market's profit-making ability is poor. We need to diversify our investment portfolios, find markets that can bring higher returns, and achieve our initial profit goals.

I know some investors are still hesitating whether to participate in this approach. Some have told me that they find it difficult to accept cryptocurrencies because it's a new concept.

When it comes to new things, I think we should approach them with an open mind instead of resisting them. Speaking of which, let me share my experience. Back in 2017, when Bitcoin was still around \$3,000, a friend of mine from Wall Street told me that Bitcoin was fascinating and suggested that I buy some.

This was my first encounter with cryptocurrencies, and like many others, I was very resistant to this new phenomenon. I couldn't see it or touch it, so what was the point of buying it?

It was this emotional resistance to new things that prevented me from delving deeper into cryptocurrencies, analyzing the advantages of blockchain technology, and so on. Because of this, I missed out on a huge wealth opportunity.

I remember that my friend spent less than \$100,000 to buy 30 Bitcoins back then, and he has held onto them until now. The current value is $30 * \$60,000 = \1.8 million. I believe this wealth could allow many people to enjoy a comfortable retirement, right?

So, we need to learn to embrace new things, as they often contain new wealth opportunities. This is similar to how companies engage in research and development; only new technologies and new products can bring extra high profits to a company. Why is it difficult for large companies to emerge in traditional industries? Because the technology is already mature, and the wealth they can generate is limited unless they achieve a monopoly.

Therefore, after that experience, I changed my way of thinking. I now try to explore and analyze any new things. Regarding cryptocurrencies, whether you choose to invest now or not, I believe it's worth spending some time researching and analyzing them.

So, for this opportunity to experience cryptocurrency contracts with a small capital cost, I hope everyone takes it seriously. Familiarizing yourself with and understanding cryptocurrencies is beneficial for every investor, wouldn't you agree?

Alright, let's do a brief summary for tonight. After class, you can familiarize yourself with the ETH contract trading process. You can buy one ETH contract long position and close it when you achieve a profit of over 30%.

If the target is not reached, just hold onto it. Don't worry about losing funds because as long as you sign in daily and answer questions, you can exchange points for AUMT tokens every week. In short, every investor should become proficient in trading ETH contracts!

Alright, due to time constraints, we will end tonight's session here. Thank you all for your enthusiastic participation!

Tonight's Q&A

1.What are the three main reasons for the mistakes in contract trading?

2.Did you make a profit in ETH contract trading today? If so, what is your profit percentage?

Share your answers with Liliana, and you will receive 20 points regardless of whether your answers are correct or not.

Investors who wish to participate in ETH contract exercise tomorrow, please prepare as soon as possible. If you encounter any problems while registering for an Alaicoin exchange account, please leave a message for Liliana immediately.

Good night everyone! Looking forward to continuing our discussion and exchange tomorrow. Good night, investors!
