

G'day, dear investors! I'm White Green!

Following yesterday's negative impact of CPI inflation data significantly exceeding market expectations, the three major indices continued their decline today. After falling for two consecutive days, how will the market perform tomorrow? Although the overall market performance is poor, the stocks in our investment portfolio have all risen against the trend. Can these stocks maintain their upward momentum? Tonight, I'll share and explain this point with investors.

In addition, I'll share my personal story with investors tonight, hoping to provide some inspiration for those investors who have been deeply involved in the financial market but have not yet received generous returns.

Starting with an initial USD 770K, my total assets grew to USD 4M through nearly three years of hard work. It took me less than two years to increase from USD 4M to USD 20M. Do you know how I gradually achieved this goal? What key strategies and the importance of execution were involved in this process? I hope my personal experience can enable you to feel the real "magic" of contract trading and provide investors with valuable insights.

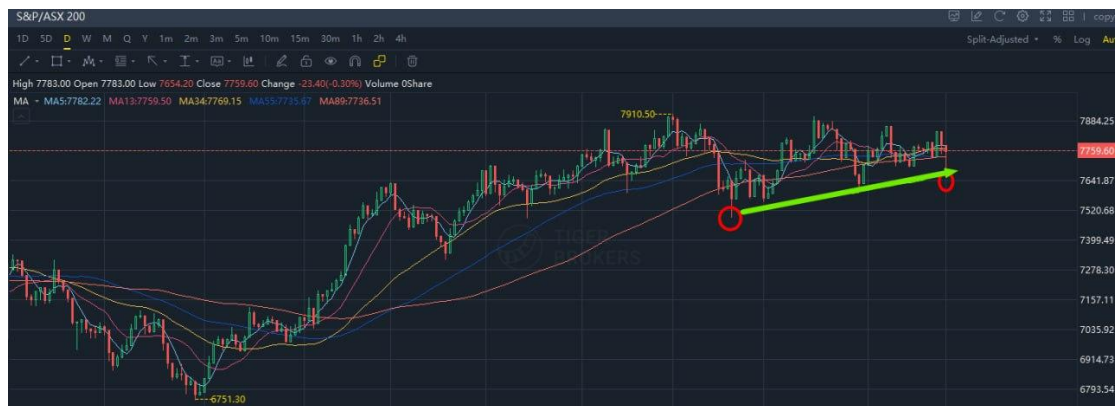

A wave of anxiety swept through the Australian market today as investors grappled with the implications of yesterday's higher-than-expected CPI data.

Fears that the Reserve Bank of Australia (RBA) may further delay its anticipated interest rate cuts fueled market apprehension, leading to a continuation of yesterday's downward trend across the ASX's three major indices.

The XJO Index plunged by over 128 points during intraday trading, representing a decline of more than 1.6%. However, a late-session rally fueled by the financial, resources, and healthcare sectors provided some respite, allowing the indices to stage a partial recovery.

The real estate sector continued its downward trajectory from yesterday, emerging as the day's worst performer with a decline exceeding 2%. The industrials and utilities sectors also joined the ranks of laggards, while information technology, healthcare, and non-essential consumer goods sectors bucked the trend with modest gains.

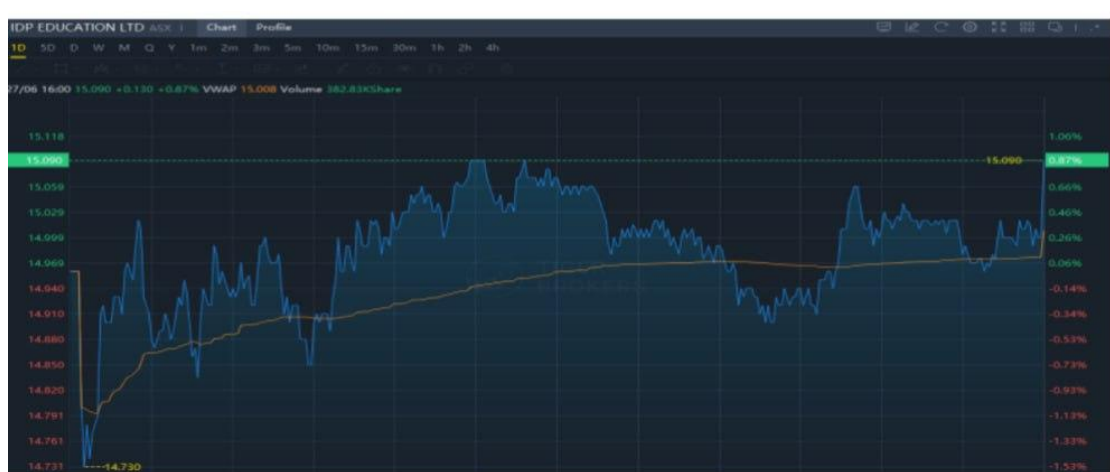

The XJO Index briefly breached its crucial 89-day moving average support today, reflecting the prevailing undercurrent of bearish sentiment among market participants.

However, the index staged a swift recovery, propelled by heavyweight sectors such as financials, and closed back above the MA89, forming a long lower shadow on the daily candlestick chart.

Today's market action suggests a strong presence of bulls defending support levels, likely driven by anticipation of the release of the US core PCE data tomorrow evening, which is generally expected to be market-supportive.

From a technical perspective, the S&P/ASX 200 Index has been consolidating tightly within a wedge pattern on the daily chart for most of this month.

As we approach the end of the month and the final trading day of the week, with no significant news catalysts on the horizon, the market is likely to continue its pattern of weak, choppy trading.

Today, the individual stocks in our portfolio shone brightly! Despite the ASX's three major indices all declining, our portfolio stocks demonstrated remarkable resilience, rebounding against the trend:

First, let's look at CWY. Today, it staged a strong rebound, supported by the MA55 moving average, and closed firmly above all short-term moving averages. Technically, CWY maintains a bullish stance, with ample momentum for future gains.

Next is IEL, which has risen for four consecutive days this week, with today's closing price near the MA13 moving average. With the gradual repair of its technical pattern and strong institutional buying, IEL has further upside potential and has performed impressively.

Finally, there's PLS. Despite the decline in the lithium-cobalt sector index, PLS has continued to rise strongly. PLS has outperformed the related sector index for four consecutive days this week, further solidifying its leadership position in this sector. Tomorrow, we need to watch if its price can stay above the MA13 moving average. If it does, today's "doji" pattern might lead to a similar upward acceleration as seen with IEL's "doji" on Tuesday.

Overall, despite the market's weak performance, our portfolio has shown strong resistance and upward momentum, with individual stocks moving in line with our expectations.

Although our recent returns in the stock market have not been satisfactory, and many investors have started to question my investment philosophy and teaching methods, doubting my professionalism, I want to reassure you that the stocks I recommend are leading listed companies with solid fundamentals. Short-term market mispricing does not mean these stocks lack future value.

As seen in the past two days of significant market adjustments, our stocks have risen against the trend. For example, IEL, which I suggested investors to buy at near the lowest price, has not caused significant losses, and some investors have even realized profits. Additionally, PLS has recently shown a stable bottoming trend with continuous institutional investment. I believe that with more institutional funds flowing in, PLS's short-term price will see a decent rebound.

For those who trust me and have joined me in exploring the opportunities in IEL and PLS, the current prices are moving towards our positive expectations. Please continue to have faith; good news in the market is yet to come.

Although our investment portfolio is heading in a positive direction, PLS is still some distance away from our cost price. This is one of the reasons why we are actively exploring cryptocurrency contracts. We need to find out if there are other markets with better profitability than the stock market.

Today's ETH contract trading practice has given me great confidence. This afternoon, in less than 20 minutes, we achieved a 40% return on the ETH/USDT contract. This is the profit charm of the cryptocurrency contract market.

I also saw that most investors shared their orders in the group, and most investors made good profits. Today's overall trading was much smoother than yesterday's. This is the purpose of practice. We keep operating, continuously familiarize ourselves with the entire operation process, and reduce our mistakes so that we can profit steadily in the cryptocurrency contract market.

I also believe that with our repeated practice, we will get better and better, and each operation will move us closer to our profit goals.

After our great success in the contract market today, many investors privately asked me a question. They feel that cryptocurrency contracts are indeed profitable and suitable for their investment. They want to pool their funds to recover the losses from the stock market.

I understand your urgent desire to recover losses and make more money as soon as possible. Who wouldn't want everyone to make money quickly and recover our stock market losses in a day? That would greatly reduce my pressure. To be honest with you, since the poor performance of PLS and IEL stocks caused losses, I haven't had a good night's sleep. Every night, I need medication to barely fall asleep.

We are all strangers brought together by fate, but you all chose to trust me unconditionally and bought the stocks I recommended. The losses have made me feel deeply guilty.

Although we have made money in the cryptocurrency contract market now, I strongly urge everyone not to increase their investment at this time. Having learned from our stock market losses, I must now be responsible for every fund of your investment. We are still newcomers to the cryptocurrency market, and we are not yet familiar with the entire process. If you increase your investment now, a single mistake could result in significant losses. How could I face you then?

When I recommended the stocks initially, I did not know everyone's financial situation and did not specify how much to invest. As a result, some friends with larger investments suffered more significant losses. This is another reason why I feel deeply uneasy. Therefore, I hope you all understand my current feelings and do not put more pressure on me.

We will now use the funds exchanged with your points for operations and practice. We aim to improve our operational proficiency with the lowest cost.

For investors who are new to the cryptocurrency market and have just had their first practical experience, the returns today were relatively small since no additional funds were invested. However, this practical trading session allowed you to gain a more intuitive understanding of the charm of cryptocurrency contract trading and a deeper insight into the cryptocurrency market.

By participating in risk-free practical trading, you can objectively assess the speculative opportunities and market risks in the cryptocurrency field. This helps you decide whether this investment method fits your trading system and whether to include it in your diversified investment portfolio. For newcomers to the market, I believe that personal experience is more important than short-term gains. What do you think about?

Of course, another reason I hope everyone refrains from increasing their investment funds right now is my concern about your execution capabilities. This is something I emphasized with everyone last night.

Today, some investors made a 30% profit, but I also noticed that a few investors only made 20% or 15%. The main reason for this disparity in results is execution capability.

The cryptocurrency market moves very quickly. If you can't enter the market immediately when I give an order, or fail to close your position in time, our profits will be significantly reduced.

Dear investors, in the contract trading market—whether it's cryptocurrencies, forex, or commodities like gold—there are many trading opportunities every day, but truly certain opportunities are rare.

When market opportunities arise, if you lack timely execution, you might miss out on great opportunities. Please take this seriously and improve your execution capabilities so that you can better seize future trading opportunities with certainty.

For example, when last month's non-farm payroll data was released, many experienced cryptocurrency investors in our community were already trading cryptocurrencies. At that time, I also provided my trading strategies and suggestions. Although I predicted that the non-farm payroll data would be unfavorable for the cryptocurrency market, I did not suggest everyone short the market directly, as the data did not fall within my range of certainty for trading. However, when a clear shorting opportunity appeared around the \$71,200 mark, I immediately shared this information.

In this significant downward trend, investors with strong execution capabilities seized the opportunity and earned profits exceeding \$2,000. On the other hand, those who hesitated became more cautious during the price decline, fearing a short squeeze, and ultimately missed out on the subsequent profits from the fall.

This is similar to today's ETH/USDT contract trading. A small number of investors missed out on the profits from the ETH/USDT contract or reduced their gains due to a lack of execution.

So, dear investors, especially those who are new to the cryptocurrency field, even after a period of risk-free practical trading, if you find that cryptocurrencies are not suitable as part of your investment portfolio, remember that execution capability is equally crucial in other markets. The effectiveness of any market operation strategy depends on your ability to execute these strategies accurately and promptly. Whether it's taking profits, stopping losses, or timing the market entry, investors need to have excellent execution capabilities.

As I mentioned before: Do you think execution is important? If it is, how important is it? Investors need to seriously consider this question again!

Next week, the U.S. will release the latest non-farm payroll data, which will cause significant volatility in the prices of financial products such as stocks, cryptocurrencies, and forex. In the upcoming market next week, I will lead you to experience the impact of the non-farm payroll data on the contract trading market and appreciate the unique allure of cryptocurrency and non-farm payroll data trends.

Of course, to participate in such short-term high volatility trading, we first need to be proficient in our operations, and secondly, we need execution capability. It is possible that a single trade may take only a few minutes, and the profit could exceed 100%.

Dear investors, I believe that if you have \$100,000 on hand, we can capitalize on various market opportunities in the financial markets to earn \$1,000,000. However, before we proceed, I do not want those who have never engaged in contract trading to rush into the market. Although contract trading, with its flexibility, trading opportunities, and the allure of leveraging small amounts to achieve big gains, attracts investors worldwide, it also comes with significant trading risks. You need to understand that the opportunities and risks in the market are always balanced.

Therefore, I hope to guide you through practical trading experiences with cryptocurrency contracts, allowing you to deeply understand the opportunities and risks of contract trading. Through hands-on experience in different markets, you can truly determine which type of trading best suits your habits and becomes the best choice for your diversified investment portfolio.

Especially for those busy working investors who still strive to learn, I encourage you to find time and immediately contact my assistant to register for a contract trading account. Follow my lead and experience trading in different markets. This is not just a risk-free practical investment opportunity but also a journey of wealth accumulation.

When I first jumped into the stock market, I started with \$770k USD. Why \$770k? Well, 7's me lucky number, innit? After three years of graftin' in the stock market, I hit a mill. Then, in less than two years, I went from 4 million to 20 million USD.

Now, I bet you're wondering how I did it, right? To some investors, it seems crazy - it took three years to build \$4 million and then skyrocketed to \$20 million in a little over a year. Some may think it's impossible, but experienced futures traders know how I did it.

Contract tradin' is a hoot for investors worldwide, no matter if it's forex, crypto, gold or whatnot. It's got its own special charm. With leverage, ya can boost your investment returns. Sure, it comes with higher risks, but if you've got a solid strategy and manage your risks well, the returns can be bloody fantastic.

For folks like me, contract tradin' ain't just an investment method; it's an exciting, adrenaline-pumping adventure in the market. I reckon anyone can make their financial dreams come true with strong execution skills and a strategic approach to tradin'.

As an everyday investor, I built me wealth and achieved financial freedom by takin' advantage of the rippin' opportunities in the financial markets. Here's me story – hope it gives ya some inspo!

I started my stock market journey with \$770,000, investing mainly in US stocks and Australian resource stocks. I invested in high-quality listed companies for the long term and used swing trading to reduce costs. After three years of hard work, my account grew from \$770,000 to more than \$4 million.

Next, I transferred half of my stock account to a contract trading account. I started trading forex, gold, oil, and agricultural commodities. By understanding the market and using a flexible trading strategy, I grew my contract account from \$2 million to nearly \$17 million in just over a year. Throughout the process, I balanced like a hawk and used fixed single-layer holdings and 200x leverage for contract trading. In less than two years, I made about 130 contract trades and my contract account reached nearly \$17 million.

With me stock account profits, me total financial account assets passed \$20 mill. From \$770k to \$20 mill – it's been a helluva ride! This journey's more than just numbers; it's proof of me trust in the markets, confidence in meself, and execution skills.

Hope me story gets ya fired up to achieve financial freedom through sheer hard yakka and the right strategies.

In our group, there are many seasoned contract traders. Have you ever wondered why, despite battling in the contract trading market year after year, your account profits have not significantly increased? Do you know what the biggest difference between us is? I believe there are two main reasons for this situation:

1. Inefficient Use of Funds

Many investors, whether in the stock market or the contract market, allocate their funds haphazardly without strict financial planning. This leads to low capital efficiency and an inability to fully harness the power of compound interest.

Einstein once said, "Compound interest is the eighth wonder of the world. He who understands it, earns it; he who doesn't, pays it." Compound interest plays a crucial role in our investment careers. Do you remember the example I shared earlier? Suppose you have USD 100,000 in the financial market and can earn a 10% return each month. How much would your returns be after one year?

$$U=100,000 \times (1+0.10)^{12}$$

$$U=100,000 \times (1.10)^{12}$$

$$U=100,000 \times 3.138428$$

$$U \approx \$314,000$$

Many investors think that earning 10% per month is not much, but do you know the power of compound interest? If you can make the right trade 12 times in a row, your returns will reach approximately USD 314,000. Of course, we can't always achieve a 10% return every time, and sometimes we will encounter losses, which will extend your time frame and the number of trades required.

In the contract trading market, various financial instruments offer many trading opportunities daily. Just like today's ETH/USDT trade, investors once again earned between 20% and 40% returns. You only need to make one trade per month, capturing one decisive market movement to achieve your expected returns. The key lies in persistence and execution, seizing opportunities, and maintaining a stable strategy. Over time, you will see astonishing growth in your returns.

2. Lack of Execution and Frequent Trading

Lack of execution is another reason many experienced investors fail to make money in the market. Many people frequently trade when they see price fluctuations, without strictly following their trading system. As a result, they continuously experience gains and losses, leading to stagnant investment returns.

You need to understand that when your market value shrinks by 50%, it requires a 100% increase to reverse the loss. Frequent trading only leads to more mistakes and affects your investment returns. Whether in the stock market or contract trading market, many seasoned traders make this mistake. Ask yourself, do you often make such mistakes?

What we need to do is seize decisive market opportunities, reduce investment mistakes, and improve our win rate. Through the power of compound interest, our investment returns will grow larger and larger. Fellow investors, do you agree with my views?

In contract tradin', me whopping success is all thanks to me tradin' principles. Before each trade, I always check me account balance and use fixed single-layer positions with 200x leverage. This maxes out me capital efficiency and harnesses the bonza effect of compounding.

Heaps of investors in our circle ace risk capital management, but often lack proper compounding growth management. I reckon compounding's the key to growin' wealth, so I focus on achieving it through savvy money management.

Another crucial principle in me tradin' habits: never makin' trades I'm unsure of. I strive to minimise the chance of stuffin' up, preferring no trade to a bad one. This caution and patience help me maintain high-performing, stable operations in contract tradin'.

These tradin' habits not only boost me capital efficiency but also slash tradin' risks significantly. It's a rippin' approach worth considerin' and learnin' from for other investors. Hope y'all stick to principles, manage funds wisely, and achieve steady wealth growth in your tradin'.

Contract trading is favored by global investors because of its charm, which lies in the opportunity to leverage small amounts for significant gains, flexible trading directions, diverse investment options, and high liquidity. These attributes allow investors to quickly capture profit opportunities amidst market fluctuations. However, to achieve rapid wealth accumulation, reasonable strategies and strict execution are essential.

Investors, if you can adhere to the two points I just mentioned: firstly, only participate in certain market conditions to improve the success rate of each trade; secondly, use your funds wisely—when a certain market condition arises, boldly operate with 200x leverage. By doing so, you can, like me, expand your contract trading account's returns from USD 2 million to USD 17 million through over 130 practical trades. If your market analysis skills are stronger and your execution is better, you could achieve this goal with just 80 contract trades within two years.

So, what are certain market conditions? How can you achieve trading under certain conditions to improve your win rate in the financial market? In tomorrow's session, I will explain this in detail, helping you master this critical skill better.

Of course, to achieve rapid wealth growth, choosing the most favorable investment market with the most noticeable profit potential is crucial. The cryptocurrency market has emerged as the best-performing market from last year to this year, and there are specific reasons for this.

Therefore, dear investors, if you have not yet registered a contract trading account, please make sure to contact Liliana after the session to register a cryptocurrency account. Listening to me share a hundred times is not as meaningful as practicing once yourself. By combining the knowledge shared in the sessions with your own hands-on experience, you will gain a deeper understanding of the cryptocurrency field.

After registering your account, you will have the opportunity to operate personally, experiencing market fluctuations and the excitement of trading. Imagine, it's like listening to me explain swimming techniques by the poolside — it's more practical to jump into the water and try it yourself. Only through actual operation can you truly understand and master the trends and strategies of the cryptocurrency market.

Tomorrow, we will continue our cryptocurrency ETH contract trading practice. If you missed the practice opportunities yesterday and today, make sure to catch up tomorrow. If you are always lagging behind, your wealth growth rate will be far below others.

So, make all the necessary preparations and let's go at it again tomorrow!

Due to time constraints, today's session ends here. I sincerely thank every participant for their enthusiastic involvement!

Tonight's quiz:

1. What are the two main reasons affecting your account's profitability?
2. If you have USD 100,000 and earn 10% per month, what will your investment returns be after one year?

Have a pleasant evening, everyone! I look forward to discussing certain market conditions with you tomorrow.

Good night, investors!
